Serum Anti-HCV

Non-Reactive

Cutoff
Value

1.00

Patient
Value

0.10

Non Reactive < 1.0 | Reactive ≥ 1.0

Interpretation:

- Anti-HCV is a screening test for Hepatitis C which detects antibodies to Hepatitis C virus (HCV) infection.
- A reactive result indicates that the patient has evidence of acquisition of the HCV infection, particular chronic HCV infection, and it should be followed by HCV RNA testing.
- A non-reactive result does not rule out the possibility of HCV exposure or infection as it may be seen in severely immuno-compromised patients, patients on dialysis, or acute HCV infection.
- False positive results, though less frequent, may be due to passively acquired anti-HCV antibodies from blood transfusions, heterophile antibodies, or cross-reactivity with other viral infections.

Methodology: Anti-HCV test is performed on fully automated Chemiluminescence Microparticles Immunoassay Analyzer (CMIA), Abbott Alinity i.

Reference: Centers for Disease Control and Prevention - CDC Recommendations for Hepatitis C Screening Among Adults

Note: Two lab intercomparison cannot be done due to difference in sample collection, transportation, storage, sensitivity, and specificity of assay.

Electronically verified report. No signature required. Lab reports should be interpreted by a physician in correlation with clinical and radiologic findings.

Dr. N. A. Malik
M.B.B.S. (Pb) , M. Phil.
Consultant Haematologist
